The field of genetics is so mysterious, but unlocks such potential in people’s lives. When your organization is part of the National Institutes of Health’s Undiagnosed Diseases Network and is the top NIH-funded genetics department in the country, the public looks to your experts for the best, most up-to-date information.

To answer the demand, Baylor College of Medicine’s Department of Genetics and Texas Children’s Hospital partnered on a seminar series on genetics and family health. At each session, the public is invited to discuss different genetic conditions or rare illnesses, such as autism, Down syndrome or new genetic testing methods.

Look in the Medical and Science section every Monday and visit bcm.edu to see how Baylor is achieving the amazing in our community.
