The Division of Surgical Research was established group in the Michael E. DeBakey Department of Surgery to meet the challenges of an increasingly competitive and rapidly advancing research climate. The mission of the division and its 12 primary (Ph.D.) and 14 joint faculty members is to promote the development and growth of highly successful research and training programs by providing a supportive environment for investigators and trainees.

Under the leadership of Changyi Johnny Chen, M.D., Ph.D., the division brings together department researchers to share ideas, to benefit from each other’s knowledge and experience, and to lend support in grant and publication efforts. At the same time, the division aims to create a critical mass of well-recognized researchers with whom other investigators at Baylor College of Medicine and elsewhere can readily collaborate.

Based on the fourth and fifth floors of the Margaret M. Alkek Building for Biomedical Research at BCM, the primary objective of the division is to understand the underlying mechanisms of surgical disease through basic science and translational research. Division members aspire to identify novel treatments and ultimately link laboratory discoveries directly with clinical care.

To further the department’s international reputation for excellence in surgical research, the division cultivates mentoring and training opportunities for junior faculty, surgical residents, fellows, and students in a structured environment. Division members are assisted with their research efforts by a core group of clinical trials coordinators, a biostatistician, a database manager, a medical editor, a medical illustrator, and pre- and post- grants managers led by department Vice Chair for Research Scott A. LeMaire, M.D.
Changyi (Johnny) Chen, M.D., Ph.D.
Professor and Chief, Division of Surgical Research

Molecular Surgery Endowed Chair
Department of Molecular and Cellular Biology
Baylor College of Medicine

Keywords
• Angiogenesis
• Atherosclerosis
• Cardiovascular disease
• Endothelial dysfunction
• Endothelial nitric oxide synthase
• Hemodynamics
• Oxidative stress and antioxidant
• Pancreatic cancer
• PLGA-based nanotechnology
• Vascular tissue engineering

Research interests
Dr. Chen’s laboratory is actively conducting several basic science and translational research projects that are highly relevant to clinical cardiovascular disease and pancreatic cancer.

Cardiovascular risk factors and their molecular mechanisms in cardiovascular disease
We are investigating the effects and the molecular mechanisms of several cardiovascular risk factors, including HIV protease inhibitors, the adipokine resistin, soluble CD40L, and uric acid, on biochemical pathways associated with endothelial cell functions. Some of the biochemical pathways under investigation are the endothelial nitric oxide synthase system, the oxidative stress system, and signal transduction pathways. We are carrying on these investigations using several experimental models, such as myographies, organ cultures, mouse models, human tissue samples, and different types of endothelial cells. Based on the molecular mechanisms we uncover, we develop effective therapeutic strategies to treat endothelial dysfunction and atherosclerosis.

Endothelial cell differentiation and angiogenesis
We are studying the role played by and the molecular mechanisms of hemodynamic factors and several novel molecules on endothelial cells differentiated from embryonic stem cells and from bone marrow-derived stem cells. We are identifying key regulatory genes that trigger endothelial cell differentiation and promote stable angiogenesis. These findings can potentially be applied to the design of novel therapeutic strategies to treat ischemic tissues using genetically engineered endothelial cells. In addition, these studies may provide useful information to genetically engineer novel tissues for vascular grafts.

Pancreatic cancer
We have been heavily involved in pancreatic cancer research programs for many years. We have several projects focusing on the role and on the mechanisms of several genes, such as microRNA 196a (miR-196a), X-inactive specific transcript (XIST), and Jude-2 in pancreatic cancer. Our comprehensive studies analyze human cancer specimens, clinical outcomes, established cell
lines, a nude mouse model, and a genetically engineered mouse model of pancreatic cancer called the KPC model. We are developing PLGA [poly(lactic-co-glycolic acid)]-based nanotechnology for molecular imaging and for specific drug and gene delivery, which has great potential clinical applications, such as molecular diagnostics and targeted therapies.

Selected publications
Xin-Hua Feng, Ph.D.
Professor Michael E. DeBakey Department of Surgery
Department of Molecular & Cellular Biology

Keywords
• Embryonic stem cells
• Serine/threonine phosphatases available
• SMADs
• SUMOylation
• TGF-β/BMP
• Ubiquitination

Research interests
Dr. Feng’s research aims to elucidate the underlying mechanisms and interplays among protein modifications, signaling pathways, and gene transcription as well as understanding their roles in cell proliferation, tissue differentiation, and pathogenesis of human diseases.

His current research projects include:

Phosphatome: genome-wide investigation of protein dephosphorylation
Signal transduction pathways are often regulated by the dynamic interplay between protein kinases and phosphatases. Using all the human protein serine/threonine phosphatases available, we systematically investigate the effect of dephosphorylation on key proteins involved in cell signaling and cell functions. We are currently genetically disrupting individual phosphatases to elucidate their in vivo functions during development.

SUMO, ubiquitin, and control of protein turnover and functions
We examine the effect of post-translational modifications, particularly ubiquitination and SUMOylation of transcription factors, in normal and cancer cells. We attempt to understand the molecular mechanisms by which environmental and developmental cues regulate the ubiquitination/proteasome and SUMOylation systems. Our studies will provide insights into the relationships between protein deregulation and human cancers or abnormal development.

TGF-β/BMP signal transduction
SMADs are evolutionarily conserved signal transducers and transcription factors controlling TGF-β/BMP functions. A large number of mutations that inactivate SMADs have been linked to human cancers and genetic diseases. We address the molecular interactions, requirements, and functionality of SMADs in TGF-β/BMP responses using cellular, genomic, and proteomic approaches. We investigate how SMADs mediate transcription and how their actions are terminated. We also use in vitro and in vivo model systems to study how SMADs as tumor suppressors interplay with oncogenic pathways, in particular with those involved in lymphoma and in pancreatic and breast cancer.

Genetic screens, BMP/TGF-β signaling, and ES cells
We are conducting genome-wide studies (e.g. genetic screens using lentiviral RNAi library) to
identify novel TGF-β signal modifiers or regulators involved in stem cell differentiation. Novel molecules that control TGF-β/BMP signaling or participate in human ES cell self-renewal and differentiation will be further studied and in model organisms to define the molecules’ physiological roles in tissue differentiation and organ development.

Immune suppression by TGF-β
TGF-β is a major inflammatory and immune-regulatory cytokine, but the mechanisms by which TGF-β exerts its actions are unclear. We are interested in investigating the signaling interactions between the TGF-β pathway and other cytokine pathways (such as TNF-alpha, IL-1, and IL-6 pathways) in immune responses. This area of research may lead to the discovery of drugs to treat cancer and inflammatory diseases.

Selected publications
Keywords
• Pancreatic cancer
• HIV
• Immunotherapy
• Mesothelin
• MicroRNA

Research interests
My research programs include HIV vaccine development, pancreatic cancer pathogenesis, and therapy. Specifically:

• Developing chimeric virus-like particle HIV vaccines
• Understanding the functional roles of mesothelin in pancreatic cancer pathogenesis
• Understanding the functional roles of miR-198 in pancreatic cancer pathogenesis
• Understanding the functional roles of axon guidance gene Semaphorin 3E in pancreatic cancer pathogenesis
• Developing targeted nanoparticle therapy in pancreatic cancer
• Developing immunotherapy for pancreatic cancer

HIV Vaccines
My lab is interested in developing non-infectious HIV virus-like particles (VLPs) as candidate HIV mucosal vaccines for both preventive and therapeutic purposes. In preclinical studies, VLPs formed by structural proteins are highly immunogenic and capable of inducing protective immunity against various viral infections. We have modified vaccine immunogens into chimeric HIV VLPs which contain influenza viral surface glycoprotein HA or other immunologically functional molecules. We have shown that the chimeric HIV VLPs can induce enhanced humoral and cellular immune responses against HIV in a mouse model.

We have also studied the basic mechanisms of VLP-induced humoral and cellular immune responses, and other factors that affect these responses. For example, we found that VLP vaccines activate conventional B2 cells and promote B cell differentiation to IgG2a producing plasma cells; that VLP vaccines travel to the lymph nodes upon immunization and can be directly visualized by optical imaging techniques; and that intradermal immunization generates improved responses and might be a preferable delivery route for viral and cancer immunotherapeutic studies involving VLPs.
Since dendritic cells (DCs) have long been known to be pivotal in initiating immune responses, we are also interested in how VLPs modulate DC functions and will evaluate the efficacy of VLP-pulsed DC vaccines. In addition, we are interested in testing the efficacy of modified chimeric VLP oral-mucosal immunization in non-human primates.

Pancreatic cancer pathogenesis and therapy

Pancreatic cancer has one of the highest mortality rates and ranks as the fourth leading cause of cancer death in North America. Survival is poor because there are no reliable tests for early diagnosis and no effective therapies to treat metastatic disease. There is a need to better understand the molecular mechanisms of pancreatic cancer tumorigenesis and to develop effective treatments. My lab currently focuses on the study of key molecules in pancreatic cancer, including mesothelin (MSLN), trop2, and semaphorin 3E, and in their mechanisms of regulation. I am also interested in the involvement of microRNAs (miR-198) in pancreatic cancer, and how their dysregulation leads to pathogenesis. We are also currently exploring tumor-associated molecule targeted therapies and RNA interference delivery by liposomes and PLGA nanoparticles in vivo. Our group has shown that vaccinating mice with chimeric virus-like particles containing MSLN significantly inhibited tumor progression, suggesting a new therapeutic vaccine strategy whereby MSLN is targeted to attempt to control pancreatic cancer progression. We are also employing a K-ras mutation spontaneous pancreatic cancer mouse model to study prevention and the potential of our therapeutic regimens.

Michael E. DeBakey Department of Surgery
Department of Pathology and Immunology

Keywords
• Breast cancer
• DNA damage response pathways
• DNA repair
• Knockout mouse model
• Liver cancer
• Pancreatic cancer
• Synthetic lethality
• Targeted cancer therapy
• Tumor Suppressor

Research interests
My research goal is to develop novel cancer therapies by identifying new key pathways for
cancer development and progression.

There are three major areas of investigation in my laboratory:

Characterization of the function of DNA-repair proteins in tumor suppression using both
knockout mouse models and clinical specimens
BRIT1/MCPH1 knockout mice have been generated in the lab and BRIT1’s role in the
suppression of breast, liver, and pancreatic cancer is studied extensively using the unique
knockout mouse model, as well as clinical specimens.

Development of cancer cell-specific therapies by targeting DNA repair deficiency in cancer
We use a synthetic lethality approach and combination therapy to develop more effective
treatments for breast and liver cancer.

Identification of novel key oncogenes that drive breast and liver cancer development
Using a bio-informatics approach, we select candidate genes by analyzing The Cancer Genome
Atlas (TCGA) data and we characterize the genuine functions of these candidate genes in vitro
and in animal models.

Research interests

Barbara W. Trautner, M.D., Ph.D., is an infectious diseases clinician-investigator at Baylor College of Medicine and the Michael E. DeBakey Veterans Affairs Medical Center, affiliated with the Center for Innovations in Quality, Effectiveness, and Safety (IQuEst). Her primary research interest is the development of new strategies for the prevention of catheter-associated urinary tract infection (CAUTI). She has worked in this area for the past 13 years, supported first by an NIH K23 award and then by a VA Career Development Award. While on career development award support, Dr. Trautner obtained her PhD in clinical investigation from Baylor College of Medicine Graduate School of Biomedical Sciences. Her interest in CAUTI prevention has led her to develop two productive branches of investigation, one in health services research and one in microbiology translational research.

Dr. Trautner’s outcomes research has focused on reducing antimicrobial overuse, particularly for the extremely common condition of catheter-associated asymptomatic bacteriuria. Her team recently completed a successful VA Health Services Research and Development merit review project utilizing guidelines implementation to decrease inappropriate treatment of catheter-associated asymptomatic bacteriuria. She is also involved in a nationwide project funded by the Agency for Healthcare Research and Quality to decrease CAUTI and antimicrobial overuse in long-term care facilities.

The overall goal of Trautner’s translational research has been to develop novel strategies for prevention of CAUTI in persons who have chronic bacteriuria, such as those with neurogenic bladders or chronic indwelling catheters. One area of investigation is bacterial interference, or using benign bacteria to prevent symptomatic infection with pathogens. In clinical trials Dr. Trautner’s group utilized urinary catheters coated with a biofilm of benign E. coli to achieve bladder colonization and protection from CAUTI. Previous work also included nanoscale modification of the urinary catheter surface to create a protective biofilm.

Research interests
Dr. Lin’s research interest is on cell functions under physiological and pathological conditions. Currently, we are investigating several cell functions such as cell proliferation, differentiation, and metabolism by focusing on protein phosphatase. Specifically, we are trying to identify protein phosphatases that regulate critical signal transduction pathways such as BMP, TGF-β, insulin pathways, and gluconeogenesis. By doing this, we hope to understand better the signaling pathways that regulate normal cellular functions, and the deregulation of them leads to human diseases such as cancer, which is our main focus, bone disease, and diabetes. Eventually, we hope to provide the rationale for protein phosphatases as potential therapeutic targets.

Another major focus of her research is on the functions and regulation of TGF-β signal transduction pathway. We also investigate the crosstalk of TGF-β signal with other signaling pathways such as oncogenic pathway and hormone receptor pathway, and the role of protein posttranslational modifications (e.g. phosphorylation, ubiquitination and sumoylation) in TGF-β functions. By using cell-based assays and animal models, we seek to determine the role of TGF-β in normal cellular functions, cancer initiation, and cancer progression. Ultimately, our studies will advance our knowledge on understanding the molecular mechanisms of cancer initiation and progression, and on the identification of potential targets for cancer therapy.

Baylor College of Medicine

Keywords
• Cardiovascular disease
• Cardiac regeneration

Research interests
Heart failure is a leading cause of death in developed countries. Recent advances in interventional cardiology and cardiac surgery have made it possible to save numerous patient lives after myocardial infarction. However, those patients eventually develop end-stage heart failure since the loss of cardiac muscle is never replaced with new muscle. Our study focus is on regenerating cardiac muscle by transdifferentiating cardiac fibroblasts into cardiomyocytes. We reported that Gata4, Mef2c, and Tbx5 overexpression transdifferentiated cardiac fibroblasts into cardiomyocyte-like cells in vitro, and improved cardiac function in vivo. Our goal is to translate this in-situ cardiomyocyte regeneration into clinical therapy.

Stuart Corr, BEng, MEng, Ph.D.
Assistant Professor of Surgery
Division of Surgical Research
Baylor College of Medicine

Keywords
- Nanomedicine
- Non-invasive radiofrequency hyperthermia
- Surgical Technology
- Nanomaterials characterization

Research interests
Dr. Corr obtained his BEng (hons) in Electronics with Music from The University of Glasgow. He went on to study an MEng in Electrical Systems majoring in Nano-electronics and Photonics at Dublin City University, Rep. of Ireland. During this period, he was selected for the Irish Government sponsored FÁS Science Challenge, which placed him in Dr. Lon J. Wilson’s Nanomaterials group at Rice University, Department of Chemistry where he worked on building a prototype to quantify cyclic magnetic field absorption by gadolinium loaded ultrashort carbon nanotubes (Gd3+ US-SWNTs), which are used as superlative MRI contrast agents. Having returned to Dublin to finish his masters he then completed his PhD studies, over a period of two years, in the field of silver nanoparticles and thin-films for surface enhanced raman spectroscopy of strained silicon. He subsequently spent a 3-month period at the International Space University, Strasbourg, France, as part of their MSc. in Space Studies program - a program which he is still affiliated with. With this knowledge and experience he was asked to return to Rice as a postdoctoral fellow, to synthesize and apply silver nanoparticles to non-invasive radio frequency (RF) hyperthermia, which was part of an active collaboration between Prof Wilson and Dr. Steven A. Curley, at MD Anderson Cancer Center. Since working on this project in 2009, Dr. Corr eventually transferred over to MDACC in 2011 and has since been involved in the research and development of nanoparticle-assisted non-invasive RF hyperthermia.

RF technology is gaining prominence as a powerful new surgical oncology tool in the fight against cancer. Recent work has shown synergy when combining RF therapy with systemic chemotherapy administration. His current studies have also shown enhanced delivery and retention of chemotherapeutics into tumors when exposed to low levels of RF fields. He is currently active in this field and we are currently seeking FDA approval for full human trials.

Research interests
My research is focused on several basic science and translational research projects that are highly relevant to clinical diseases and pancreatic cancer. I have a strong background and research experience in organic chemistry, medicinal and synthetic chemistry, and biochemistry, including enzyme activities and mechanisms.

In recent years, I have been studying the fields of translational medicine and medicinal chemistry, working with cell-free, well-established in vitro as well as in vivo models. The primary goal of my projects is to develop new, safe, and effective therapies using natural or naturally-derived substances. For example, I have been developing medicines for hyperuricemia-related diseases, such as gout, using natural substances and by modifying their structure to enhance their effects. Currently, I am also screening naturally-derived substances for inhibitors of enzymes such as myeloperoxidase, HIV protease, and arginase, key enzymes in the development of diseases.

Another focus of my research is the delivery of nanoparticle gene/drug complexes targeted to cancer cells as well as to vascular cells by using antibodies or other specific proteins conjugated to PLGA (poly(lactic-co-glycolic acid)-based nanoparticles. I am developing a new PLGA-based material for molecular imaging and specific drug and gene delivery, which has great potential clinical applications such as molecular diagnostics and targeted therapies.

Research interests
My broad research interest is on vascular diseases. One of my main interests is to study the molecular mechanisms of aortic aneurysms and dissections, highly lethal but poorly understood conditions. During the past few years, we have established mouse models of aortic aneurysms and dissections and developed various techniques to evaluate the aortic structure and functions. We have also developed several projects to study the regulation of aortic inflammation and destruction, as well as aortic repair and remodeling.

Yulong Liang, Ph.D.
Instructor in Surgery
Division of Surgical Research
Baylor College of Medicine

Keywords
• Breast cancer
• DNA damage response
• Double-strand breaks
• Genomic instability
• Homologous recombination

Research interests
Dr. Liang’s research focuses on elucidating the roles and the underlying mechanisms of DNA damage and repair pathways in tumor development, progression, and metastasis, as well as developing novel therapeutic methods to target cancer cells.

DNA damage response and genomic instability in cancer
DNA repair deficiency and genomic instability are important hallmarks of cancer. By elucidating the roles of BRIT1/MCPH1, an important protein involved in DNA damage and repair pathways, we provide insights into the relationship of DNA repair deficiency with genomic instability, cancer initiation, progression, and/or metastasis.

Translational research and treatment of cancer
In this area, we investigate how to target cancer cells with genomic instability, which may eventually lead to the discovery of drugs for cancer treatment.

Lisa K. Mullany, Ph.D.
Assistant Professor of Surgery
Division of Surgical Research
Baylor College of Medicine

Keywords
• Cardiac reprogramming
• Transdifferentiation
• Fibrosis

Research interests
Dr. Mullany has a broad academic and research background in immunology, pathobiology, pharmacology, tumor biology, hormone signaling and metabolism. Her most significant early career contribution was the development of the first assay to measure of the affinity of an allergen-specific immune response.

Later studies were focused on interactions between steroid signaling and cell cycle control in liver, breast, prostate and ovarian cancers.

After joining Baylor College of Medicine, Dr. Mullany developed and characterized animal models of ovarian cancer that lead to important and novel findings that the tumor suppressor gene p53 promotes the ovarian cancer phenotype and steroid hormones estradiol and progesterone mediate metastasis of ovarian cancer cells. Follow-up studies identified that specific p53 mutations are associated with unique and common pathways that can be targeted for novel ovarian cancer therapies.

Dr. Mullany’s current research interests are to identify molecular and cellular signaling pathways involved in cardiac cellular reprogramming. This exciting new area of research is being explored as a promising approach to repair damaged heart tissue to improve the lives of patients with congestive heart failure.

Research interests

Dr. Vivek Singh’s research focuses on molecular and genetic mechanisms that mediate myocardial remodeling and heart failure, and the development of new drug and gene-based therapies for heart disease. The research Dr. Singh accomplished during his doctoral and post-doctoral tenures has significantly contributed to a better understanding of the biochemical, molecular, and genetic mechanisms that regulate cardiac function.

A significant amount of Dr. Singh work has focused on the renin-angiotensin system and its direct involvement in mediating cell growth in the heart. Dr. Singh has characterized an intracardiac intracellular renin-angiotensin system and has shown that the precursor genes of the system significantly modulate a number of pathological conditions such as diabetic cardiomyopathy. Recently, he identified the genetic biomarkers predisposing to sudden death in heart failure patients and studied the underlying mechanism of ventricular arrhythmias and increased risk of sudden cardiac death in dilated cardiomyopathy. More recently, Dr. Singh examined key developmental cardiac regulators, known as transcription factors GMT (GATA4, MEF2C and TBS5), that reprogram cardiac fibroblasts into functional, beating cardiomyocytes, a novel, promising gene therapy strategy to treat heart failure.

Dr. Vivek has a vast experience working on cardiac myocytes and fibroblast both in vitro and in vivo, especially in cardiac electrophysiology. The overall summary of his work is to better understand the molecular signaling pathways, to identify genetic biomarkers and gene regulatory events that modulate cardiac function, and to better understand how these mechanisms may contribute to the development of interventions to modulate heart failure.

- Non-alcoholic fatty liver disease (NAFLD)
- Portal hypertension
- Varices
- Wilson's disease

Research Interests
Dr. Sood's primary research focuses on clinical aspects of liver disease, viral hepatitis, portal hypertension and outcome based research in cirrhosis and liver transplantation. His area of main interest is non-alcoholic fatty liver disease (NAFLD/ NASH). He is particularly interested in studying spectrum of NAFLD in different ethnic groups, with focus on genetic and metabolic differences in Hispanic population. Dr. Sood is also interested in iron overload in patient with liver disease including patients with NAFLD. Studies are currently being conducted on non-HFE related genetic markers in patients with primary and secondary iron overload. He is also involved in clinical trials of new anti viral therapies in patients with hepatitis C.

- Primary sclerosing cholangitis
- Viral hepatitis
- Wilson's disease

Research Interests
Dr. Vierling’s primary research interests are the immunopathogenic mechanisms involved in hepatobiliary injury caused by viral infection, autoimmunity, alloimmunity, and non-alcoholic fatty liver disease. Dr. Vierling’s basic science laboratory investigations have used murine models to study the immunopathogenesis of non-suppurative destructive cholangitis, which destroys bile ducts in primary biliary cirrhosis, an autoimmune liver disease, as well as in two alloimmune diseases, hepatic allograft rejection and chronic graft-versus-host disease.

By emphasizing a "laboratory bench to bedside" philosophy, Dr. Vierling has also been active in the design and execution of clinical therapeutic trials of antiviral agents for treatment of hepatitis B and C infections in patients before and after liver transplantation, trials of immunosuppressive drugs in liver transplantation and autoimmune liver diseases, trials of new therapies for hepatic encephalopathy and antifibrotic agents to prevent or reverse cirrhosis. Dr. Vierling is the author of numerous research publications, reviews and chapters on these topics.

CARDIOTHORACIC TRANSPLANTATION & CIRCULATORY SUPPORT

A key area of Texas Heart Institute research involves using ventricular assist devices for patients with advanced heart failure. These devices can be implanted as a bridge to transplant, destination therapy, or bridge to recovery.

Texas Heart Institute/CHI Baylor St. Luke’s Medical Center has one of the largest experiences in the country with LVADs. Devices include the HeartMate II, HeartMate III, HeartWare HVAD, Jarvik, and the Syncardia Total Artificial Heart.
Jeffrey Adam Morgan, M.D.
Professor and Chief
Division of Cardiothoracic Transplantation and Circulatory Support
Surgical Director, Advanced Heart Failure Center of Excellence
Baylor College of Medicine

Keywords

- Advanced heart failure
- Mechanical circulatory support
- Transplantation

Research interests

Dr. Morgan’s research is focused on advanced heart failure with numerous publications, national and international presentations, and book chapters. He is the section editor for Adult Mechanical Circulatory Support for the American Society of Artificial Internal Organs (ASAIO) Journal and is on the Editorial Board of The Journal of Heart and Lung Transplantation. He is also a reviewer for several other journals including The Annals of Thoracic Surgery and the Journal of the American College of Cardiology. Dr. Morgan served on the ISHLT Standards and Guidelines Committee and was a Task Force chair for the ISHLT Guidelines for MCS. He is also a previous chair of the Cardiac Track Programming Committee for the ASAIO Annual Conference. Dr. Morgan has moderated numerous sessions on mechanical support and transplant at ASAIO, ISHLT, and the American College of Cardiology.

Dr. Morgan is passionate about improving outcomes in patients with advanced heart or lung failure. He has participated in numerous clinical trials including Thoratec’s HeartMate II BTT and DT trials, Heartware’s HVAD BTT and DT trials, the HeartMate III trial, and Syncardia’s 50 cc TAH trial. Dr. Morgan is also investigating the utility of stem cells as an adjunct measure for myocardial recovery, as part of the LVAD MPC II trial.

Keywords

- Ventricular assist devices

Research interests

Dr. Cohn is one of the leaders of the team of experts developing a total artificial heart that will deliver blood by means of continuous flow rather than pulsation. This research has grant support from the National Heart, Lung, and Blood Institute; the John S. Dunn Research Foundation; the Alexander Family Trust; and the McIngvale family Trust. This new artificial heart is smaller, less expensive, and predicted to be more reliable than previous generations of artificial hearts.

William E. Cohn currently has 80 active or pending patents for his inventions and is the founder or co-founder of five venture-backed life science startups. In addition, Dr. Cohn is a venture partner at Santé Health Ventures, a venture capital firm focused on capitalizing early-stage life science technology.

4. Gregoric ID, Cohn WE, Frazier OH. Diaphragmatic implantation of the HeartWare ventricular assist device. J. Heart Lung Transplant. 2011 April;30(4):467-70. PMID: 21211994

Research interests

Dr. Frazier’s interest in mechanical circulatory support began in 1969, when, as a student at Baylor College of Medicine, he wrote a research paper about the experimental total artificial heart, which was first implanted in 1969 by Dr. Denton Cooley. Throughout the 1970s and 1980s, Dr. Frazier continued experimental work toward developing an implantable left ventricular assist device (LVAD) to aid the failing heart. He implanted the first LVAD in 1986 with the HeartMate I; since then this device has become the most widely used implantable LVAD in the world. In 2011, Dr. Frazier implanted the first successful continuous-flow total artificial heart using two second generation HeartMate II LVADs to replace a patient’s failing heart.

Dr. George P. Noon has focused his surgical career in organ transplantation and cardiac assist devices. In 1968, Dr. Noon, Dr. Michael E. DeBakey, and their surgical team performed their first heart and later lung transplant.

In 1988, Drs. Noon and DeBakey met with engineers from NASA to develop a miniature axial flow blood pump. Ten years later, Dr. Noon participated in the care of President Boris Yeltsin, who needed a coronary bypass operation. In the same year, the first MicroMed DeBakey-Noon human implants were performed in Berlin, Germany. In 1999, Dr. Noon was inducted into the Space Technology Hall of Fame.

Cardiothoracic Surgery

Under the supervision of Scott A. LeMaire, M.D., director of research for the Division and Vice Chair for Research in the Department, the cardiac surgery research team pursues several research projects and maintains one of the world’s most extensive and well-cataloged aortic tissue banks. This core resource facilitates investigations into the causes and progression of aortic disease pursued by our researchers, as well as researchers from other academic institutions.
Joseph S. Coselli, M.D.
Professor of Surgery
Chief, Division of Cardiothoracic Surgery
Cullen Foundation Endowed Chair
Baylor College of Medicine

Keywords

- Aortic Valve Disease
- Connective Tissue Disorders
- Aortic Aneurysm
- Aortic Dissection

Research interests

Mentored by the legendary aortic surgeon, Dr. E. Stanley Crawford, Dr. Coselli is today one of the world’s most experienced aortic surgeons and best known as the foremost expert in thoracoabdominal aortic aneurysm repair—he recently published a milestone paper describing results after 3309 such repairs. He has an extensive clinical database and encourages participation in clinical research by designing research projects based on specific interests within aortic surgery. With approval, access to de-identified data from the Aortic Surgery clinical database may be granted. Dr. Coselli routinely publishes on a wide variety of aortic topics, and several outstanding papers and presentations have been prepared by residents, fellows, and students. Key publications have influenced clinical practice trends by determining the best approaches towards preventing complications during aortic repair. Regarding thoracoabdominal aortic aneurysm repair, randomized clinical trials were conducted to establish the benefits of using cerebrospinal fluid drainage to protect the spinal cord (a technique now in widespread use in aortic repair) and renal perfusion as a protective measure against renal ischemia as well as performing retrospective analysis of left heart bypass as a protective measure against distal ischemia. Additionally, by routinely presenting informative academic lectures throughout the world, Dr. Coselli has disseminated the latest approach to surgical repairs of the aortic root (valve-sparing approaches, including those is patients with Marfan syndrome), aortic arch (Y-graft approaches, hybrid procedures), and thoracoabdominal aortic aneurysm repair (postoperative quality of life in patients with Marfan syndrome). Dr.
Coselli continuously seeks out new treatment paradigms and participates in numerous investigator-initiated and industry-sponsored research projects conducted at Baylor College of Medicine and the Texas Heart Institute; studies include the use of transcatheter aortic valve replacement, rapid-deployment sutureless aortic valves, and a wide variety of stent-grafts.

Scott A. LeMaire, M.D.

Professor, Departments of Surgery and of Molecular Physiology and Biophysics
Vice Chair for Research
Department of Surgery
Director of Research
Division of Cardiothoracic Surgery
Baylor College of Medicine

Keywords

- Aortic aneurysm
- Thoracic aortic surgery
- Aortic dissection

Research interests

The focus of Dr. LeMaire’s research program, which derives directly from his clinical interest in the surgical treatment of patients with thoracic aortic aneurysms and dissections, encompasses outcomes after thoracic aortic repair, strategies for preventing perioperative complications, genetic factors related to aortic disease, and the pathobiology of aortic wall degeneration. Dr. LeMaire’s clinical research team has had a long-standing interest in the analysis of outcomes following aortic surgery, and has conducted randomized clinical trials comparing the effectiveness of various techniques for preventing associated ischemic complications. Further, his research team has conducted several studies to evaluate the safety profile of surgical adhesives, which are an important adjunct for limiting bleeding complications during aortic repairs. In 2002, his research group initiated the Thoracic Aortic Disease Tissue Bank, which currently houses samples and corresponding phenotypic data from over 3,000 patients with thoracic aortic disease and has served as a core for the NHLBI supported Specialized Center of Clinical Oriented Research in Thoracic Aortic Aneurysms and Dissection, as well as a resource for numerous collaborative studies evaluating the genetic factors and molecular mechanisms involved in the development of thoracic aortic disease. Dr. LeMaire’s basic science laboratory is currently focusing on the role of various aspects of extracellular matrix metabolism in the development of aortic aneurysms and dissections. In particular, his group is studying the roles of destructive factors, such as inflammatory cells and proteases, as well as reparative mechanisms, such as stem cell recruitment and transformation, during the development of aortic aneurysms and dissections.

Basic and translational research have occupied a predominant position in his academic career beginning with his serving as a Clinical Fellow at the NIH, and continuing with appointments as an independent investigator with American Heart Association sponsored research support and NIH extramural funding. This effort has been highlighted by his role in the bench-to-bedside development of angiogenic therapy as a potential treatment for atherosclerotic coronary artery and vascular occlusive disease, and in our lab’s current, multi-year focus to study cardiac cellular reprogramming. This work includes the translation of early in vivo examinations of angiogenic growth factors in the mid-1980s and early 1990s into the (first in the US) adenovirus-mediated delivery of angiogenic vascular endothelial growth factor (VEGF) to the human heart, as part of a Phase I/II clinical trial in 1997-1999. Together with this experience, our current investigations of cellular reprogramming offer the exciting possibility of “bio-interventions” for the treatment of hundreds of thousands with advanced heart disease still not treatable by conventional therapies.

Congestive heart failure typically occurring as a result of myocardial infarction remains the leading cause of mortality from heart disease. Cardiac stem cell therapy has offered promise in animal and clinical studies, but remains inherently constrained by the logistical challenges of delivering and integrating exogenous cells into a host myocardium. The recent discovery that induced cardiomyocytes (iCMs) could be generated directly from somatic cells offers the exciting possibility of bypassing stem cell staging and, perhaps more importantly, converting scar fibroblasts in situ into iCMs, obviating entirely the challenges of cell implantation into a host myocardium. Rosengart and others have recently demonstrated that the administration of
a cardiac transcription factor cocktail (e.g., GATA4, MEF2c and TBX5 [GMT]) results in as much as a 50% increase in ventricular function, reduced fibrosis, and increased iCM populations in small animal myocardial infarction models. Intriguingly, also demonstrating that reductions in infarct size appear to far exceed the extent of scar re-population with iCMs, and that GMT also appears to reduce the population of (scar-producing) myofibroblasts as well as the expression of key scar remodeling cytokines. These data, and our observation that GMT efficacy is enhanced by the angiogenic pre-treatment of myocardial scar with vascular endothelial growth factor (VEGF), suggest the existence of unexplored and non-optimized underlying mechanisms. Given his long-term goal to develop a potentially important new treatment for CHF, he is studying whether cellular reprogramming can be applied to improve cardiac infarct remodeling and function by testing the serial hypotheses that: a) inadequate up-regulation of requisite reprogramming genes limits cell transdifferentiation efficiency, which can be optimized beyond current thresholds via the comprehensive application of genomic activation strategies, b) that the density of (contractile) iCMs in infarct zones as well as indirect or paracrine (i.e., anti-fibrotic) mechanisms play critical roles in GMT/VEGF mediated infarct remodeling, and c) that cardiac fibroblasts can be made susceptible to reprogramming in a clinically relevant fashion. His team will use cutting edge molecular strategies and pre-clinical animal models to execute these aims.

Congenital Heart Surgery

The Division of Congenital Heart Surgery maintains an active research program across a broad spectrum. The division focuses specifically on congenital heart surgical outcomes and quality, pediatric heart and lung transplantation, mechanical circulatory support, neurodevelopmental protection, minimally invasive repair of congenital heart defects, aortic reconstruction, surgical repair of congenital coronary anomalies, and, in collaboration with Rice University, pediatric bioengineering. Dr. Fraser and his team at Texas Children’s were the lead institution for the 17-center Berlin Heart study and implanted more Berlin Heart devices than any other center during the study. Dr. Fraser and his team were instrumental in the FDA approval process for the Berlin Heart EXCOR® device. The Berlin Heart is now the only long-term pediatric VAD now approved for use in the United States.

The Pediatric Cardiac Bioengineering Laboratory within the Division of Congenital Heart Surgery is a joint effort between the Baylor College of Medicine, Texas Children’s Hospital, and Rice University. The lab is led by Jeff Jacot, Ph.D., and is committed to developing innovative therapies that translate into clinically relevant and beneficial solutions for our patients. Research is concentrated on investigating the influences of biophysical cues such as stress, strain, shear, substrate stiffness, and electrical stimulation on the development and maturation of heart cells and tissues.

Since 2011, the Division of Congenital Heart Surgery has been an active member of the Pediatric Heart Transplant Study (PHTS), which is dedicated to the advancement of the science and treatment of children during listing for and following heart transplantation. The purposes of the group are to establish and maintain an international, prospective, event-driven database for heart transplantation, to use the database to encourage and stimulate basic and clinical research in the field of pediatric heart transplantation and to promote new therapeutic strategies.

GENERAL SURGERY

The success of the individual programs is recognizable through research funding, publications, presentations, training and academic services, which significantly enhance the national and international reputations of the department.

In the areas of clinical and basic science research, individual programs have been recognized through research funding, publications, presentations, training, and academic services.

One five-year long study published in the prestigious journal *Nature* was the first to report 16 significantly mutated genes in actual human pancreatic cancer primary tumors, including genes not previously known to be associated with the disease.

As a result of the division’s clinical expertise and research programs patients receive a highly specialized assessment, the newest treatment modalities, including clinical trials for new medications and emerging surgical techniques, and coordinated follow up of their care.
**William E. Fisher, M.D.**
Professor and Chief of the Division of General Surgery
George L. Jordan, M.D. Chair in General Surgery
Michael E. DeBakey Department of Surgery
Director, Elkins Pancreas Center
Baylor College of Medicine

**Keywords**
- Pancreatic cancer
- Gene sequencing
- Clinical trials/outcomes/quality

**Research interests**

Dr. Fisher was awarded two NIH grants in 2015. One is focused on creating a consortium among 3 high-volume pancreas centers to study outcomes of pancreatic surgery. The other is composed of 10 centers studying the relationship between new onset diabetes, chronic pancreatitis, and pancreatic cancer.

Dr. Fisher has focused his entire career on pancreatic cancer and is internationally known for his clinical work as a pancreatic surgeon, basic science research and clinical research in pancreatic cancer. As Director of the Elkins Pancreas Center at Baylor College of Medicine (BCM) he has developed and coordinates clinical care for a large pancreatic cancer patient population as well as basic science and clinical research related to pancreatic cancer being performed at BCM. Dr. Fisher established a pancreatic cancer tissue resource and extensive clinical database which serve as a vital resource for research. Dr. Fisher’s lab has studied the influence of gastrointestinal hormones, particularly somatostatin and its receptors, on pancreatic cancer growth, and the relationship between diabetes and pancreatic cancer. Dr. Fisher has also collaborated on projects examining the role PDX-1 as an oncogene, gene therapy, oncolytic virotherapy, vaccination with virus-like particles, and adoptive T-cell immunotherapy for pancreatic cancer. Dr. Fisher is also actively collaborating with investigators in the Human Genome Sequencing Center at BCM on studies sequencing the genome of pancreatic cancer and the detection of circulating DNA in pancreatic cancer patients. Dr. Fisher leads a team of research clinicians dedicated to translating discoveries from the bench to the bedside and has served as principal investigator on more than 15 clinical trials for patients with pancreatic cancer.

Research interests

Dr. Berger has an active research program in surgical outcomes and health services research. He is a member of iQuEST (Center for Innovations in Quality, Effectiveness and Safety), the VA Center of Excellence is health services research. Dr. Berger’s current work involves improving the patient discharge process in an attempt to reduce avoidable hospital readmissions. As part of this research Dr. Berger is working on using mobile technology to communicate with patients in the postop period. Another project is in collaboration with Dr. Panos Kougias. This project looks to use a scheduling algorithm that takes into account patient and surgeon factors in an attempt to better predict operative time. Dr. Berger is currently the secondary mentor for Aaron Scott. Dr. Berger was previously the primary mentor for Courtney Balentine, Celia Robinson, and Linda Li. These research residents have published more than 40 manuscripts and have won several national honors. All research residents have also been fellows of the HSRD center of Excellence.

Dr. Konstantinos (Kostas) Makris graduated cum laude from the University of Athens Medical School in Greece. He received his General Surgery training at the Mayo Clinic in Rochester, MN and Creighton University Medical Center in Omaha, NE and has been certified by the American Board of Surgery. He pursued fellowship training in Advanced Laparoscopy and Surgical Endoscopy at Legacy Health in Portland, OR, as well as further training in Endocrine Surgery at Johns Hopkins University in Baltimore, MD. He has received awards and acknowledgements by the American College of Surgeons for his participation in the contest of surgical knowledge and in the competition of surgical trainee essay, as well as a traveling fellowship award by the Society of American Gastrointestinal and Endoscopic Surgeons.

He joined Baylor College of Medicine and the Michael E. DeBakey VA Medical Center in November of 2013, where he proudly serves the veterans as a staff surgeon. His clinical practice includes all aspects of General Surgery with emphasis on Minimally Invasive Surgery, benign foregut diseases and endocrine surgery. He is the author of numerous articles, scientific abstracts and book chapters in the fields of his clinical and research interests.

James W. Suliburk, M.D., F.A.C.S.

Assistant Professor of Surgery
Michael E. DeBakey Department of Surgery

Keywords

- Mobile Technology
- Clinical outcomes
- Safety & quality in underserved populations

Research interests

Dr. Suliburk’s research program at Ben Taub Hospital offers opportunities in translational science, clinical outcomes and technology development and innovation. Research interests include clinical outcomes in endocrine surgery in underserved and minority populations, outcomes in acute care and trauma surgery and application of mobile technology to improve peri-operative surgical care and communication. The research comes from the establishment of a comprehensive and multidisciplinary treatment of endocrine surgical program at Ben Taub Hospital in addition to the creation and standardization hemorrhagic shock resuscitation pathways for severely injured trauma patients. Translational research opportunities include development of novel molecular markers to predict outcome in endocrine surgical disease (thyroid cancer, hyperthyroidism, hyperparathyroidism, and adrenal tumors) as well as metabolic markers of the endocrine response in severely injured major trauma patients. Clinical research includes outcomes analysis of access to care for underserved populations undergoing endocrine surgery along with developing novel percutaneous surgical approaches to treat thyroid, parathyroid and adrenal disease and ongoing refinement of hemorrhagic shock resuscitation strategies to improve survival in our trauma patients. Finally and perhaps most exciting is work recently begun in technology and innovation. Mobile technology has become an ever-present part of daily life and we have now begun to study and apply methods of utilizing automated mobile technology to improve communication with patients for detection of impending complications and to supplement peri-operative care for surgical patients.

Keywords
• Patient through-put in the ER

Research interests
M. Andrew Davis, M.D. is an assistant professor of surgery in the Division of General Surgery. Born and raised in Richmond, Virginia, he attended the University of Virginia where he graduated with a B.A. in Mathematics. After spending a postgraduate year abroad in London teaching math, he then went on to attend medical school at the Virginia Commonwealth University School of Medicine/Medical College of Virginia. Upon graduation he pursued his general surgery residency at Emory University in Atlanta, Georgia with a significant amount of time spent at Grady Memorial Hospital, one of the city's main trauma and indigent care facilities. After working in private practice at the completion of his residency, Dr. Davis then came back to Emory to complete a two-year fellowship in Trauma Surgery/Surgical Critical Care at Grady.

Prior research projects have included analysis and implementation of more efficient models of patient through-put in the emergency room setting. He enjoys the teaching and mentoring of residents and medical students, helping them gain an understanding of the complexities in treating surgical patients and fostering their growth within the discipline of surgery itself.

Natasha Becker, M.D.
Assistant Professor of Surgery
Division of General Surgery
Baylor College of Medicine

Keywords
- Emergency care
- Outcomes improvement
- Patient-centered outcomes

Research interests

Natasha Sarkari Becker, M.D., M.P.H., is an assistant professor that specializes in emergency general surgery and surgical critical care. Dr. Becker joins the department in the Division of General Surgery. After earning her medical degree from the University of Kentucky College of Medicine in Lexington, Kentucky, Dr. Becker completed both her General Surgery Residency and Surgical Critical Care Fellowship here at Baylor College of Medicine.

While training at Baylor, Dr. Becker spent two years concentrating on clinical research and at the same time obtained a Masters of Public Health from The University of Texas Health Science Center in Houston. Following this she relocated to Geisinger Wyoming Valley Medical Center in Pennsylvania where she served as the director of Surgical Research and as the associate program director for the Geisinger Northeast Osteopathic surgery residency program.

Dr. Becker’s research interests are patient satisfaction, communication, and improving the care delivered in emergent situations in addition to improving outcomes after emergency general surgery and the open abdomen.

Claire F. Ozaki, M.D.

Associate Professor of Surgery
Division of General Surgery
Baylor College of Medicine

Keywords

- Liver Disease

Research interests

Claire F. Ozaki, M.D. was born in St. Louis, Missouri and grew up in Hawaii and Nebraska. In 1984, she received her M.D. degree from the University of Nebraska College of Medicine in Omaha. After completing a 6-year surgical residency which included one year of research, she stayed at the University of Nebraska and completed a two year transplant surgery fellowship, specializing in liver, kidney and pancreas transplantation.

Dr. Ozaki is board certified in general surgery and has been performing complex abdominal surgeries since 1990. She now specializes in acute care general surgery. Dr. Ozaki and the acute care surgery team apply the most innovative surgical techniques and evidence-based care delivery methods, work as a team to be readily available to our patients, and achieve the highest published standards of surgical outcomes.

GENERAL THORACIC SURGERY

The division’s surgeons and staff are committed to providing outstanding clinical care, and in developing new treatments for thoracic disease through research and innovation. The surgeons perform surgical techniques and new therapies that are on the cutting edge. New technology drives their innovative techniques that lead to less pain after surgery and a speedier postoperative recovery. These surgeons are well suited to provide the best possible care available for patients stricken with lung cancer, esophageal cancer, mesothelioma and a host of other chest diseases. Together, these surgeons are leading the field of thoracic surgery forward.
David J. Sugarbaker, M.D.
Professor and Chief
Division of General Thoracic Surgery
Division of General Thoracic Surgery
Director, Lung Institute
Olga Keith Wiess Chair in Surgery
Baylor College of Medicine

Keywords
• Mesothelioma

Research interests
In 1989, Dr. Sugarbaker was a leader in the establishment of the Tissue and Blood Repository at Brigham and Women’s Hospital. One of the first tissue repositories in the US, the Tissue and Blood Repository has led to extremely fruitful collaborative research projects. Dr. Sugarbaker has mentored hundreds of residents and fellows during his time at Brigham and Women’s Hospital, a reflection of his deep commitment to teaching the next generation of physicians. His contributions to education also include establishing a unique fellowship in thoracic oncology, a minimally invasive thoracic surgery fellowship, and a visiting scholar program for thoracic surgery.

Pediatric Surgery

The Pediatric Surgery Division at Texas Children’s Hospital has the depth of expertise and specialization to provide optimal care across the surgical spectrum – from the most routine cases to the most rare and complex. Each child receives personalized care from the physician most suited to the case, ensuring the best possible outcomes. The range of surgical procedures performed by the division include fetal surgery, abdominal and thoracic surgery, minimally invasive surgery including laparoscopic and thorascoscopic diagnosis and treatment, endocrine and biliary surgery, and adolescent bariatric surgery. Our research programs are supported by the National Institutes of Health (NIH), private foundations, Texas Children’s Hospital and Baylor College of Medicine.

The Pediatric Surgery Clinical Research and Outcomes Program, in conjunction with the Texas Children’s Evidence-Based Outcomes Center and Outcomes and Impact Services, has developed and evaluated evidence-based protocols for the management of children with appendicitis. The team standardized broad-spectrum antibiotic monotherapy, the use of clinical discharge criteria and guidelines for antibiotic treatment duration in cases of advanced appendicitis. These initiatives have led to decreased resource utilization and costs and, most importantly, improved patient outcomes. Additionally, the creation of a patient and family education pamphlet has helped set expectations and shorten length of hospital stay. Future research directions include the implementation of clinical decision support tools and comparative effectiveness clinical trials.

Partnering with Texas Children’s Cancer Center, one of the largest pediatric cancer centers in the country, the Surgical Oncology Program within the Pediatric General Surgery Division performs more than 500 operations annually for children with solid tumors. Because of the volume of patients and the dedication of these surgeons to this particular population, we are able to achieve outcomes among the best in the nation.

Pediatric Surgical Oncology has an active research program. The team is studying neuroblastoma in their own basic science labs. They are also engaged in clinical research on neuroblastoma, Wilm’s tumors and hepatoblastoma, as well as leading a multidisciplinary study with Oncology, Radiology and Pathology to determine how the number of cycles of chemotherapy prior to surgery affects patient outcomes.
Jed G. Nuchtern, MD

Professor of Surgery and Pediatrics
Division of Pediatric Surgery
Chief, Division of Pediatric Surgery
Texas Children’s Hospital
Program Director, Pediatric Surgery Residency Program

Keywords
- Neuroblastoma in infants
- Tumor progression
- Cancer target discovery

Research Interests
Dr. Nuchtern leads a collaborative research program that includes translational and clinical research on developing new treatments for pediatric solid tumors, particularly neuroblastoma. The primary focus in the laboratory is identifying new targets for neuroblastoma therapy. Bioinformatic studies have identified several proteins whose expression is increased in high risk neuroblastoma tumors; the laboratory has validated these findings and demonstrated that blocking expression of these targets decreases tumor growth and progression. Current research is directed toward identifying the pathways through which these molecules affect tumor progression. In addition to these translational studies, Dr. Nuchtern is involved in clinical research on neuroblastoma in infants. Through the Children’s Oncology Group, he designed and implemented a prospective international study investigating the safety and efficacy of expectant observation as the primary treatment modality for infants with low risk adrenal tumors.

Baylor College of Medicine
Co-Director, Texas Children's Fetal Center
Pediatric General Surgery
Co-Director, Neonatal ECMO Program
Texas Children’s Hospital

Research Interests
Dr. Cass’s basic research interests center on the mechanisms of fetal tissue healing. He has shown that fetal skin and fetal arteries have remarkable healing capabilities characterized by rapid healing, minimal inflammation, and smaller scars. Dr. Cass’s research goal is to understand the mechanisms involved in these unique reparative processes in order to develop new strategies to surgically treat problems that affect the developing fetus. Another goal of Dr. Cass’s fetal tissue healing research is to develop new treatments to minimize or prevent scarring in children and adults. Dr. Cass’s clinical research focuses on treatment advances of fetal and neonatal surgical conditions.

Mark V. Mazziotti, MD  
Associate Professor of Surgery and Pediatrics  
Division of Pediatric Surgery  
Baylor College of Medicine  

Keywords  
- Minimally-invasive pectus excavatum repair  
- Advanced minimally-invasive/robotic pediatric surgery  
- Choledochal cyst laparoscopic excision  

Research Interests  
Dr. Mazziotti’s current focus is on the clinical practice of pediatric surgery in an educational setting. He has special interest and training in minimally invasive surgery, including thoracoscopic pectus excavatum repair. He has devised a novel technique for the minimally-invasive repair of pectus carinatum using conventional Nuss equipment with modifications. He has studied how various stabilization techniques have improved outcomes in pectus excavatum patients.  
Dr. Mazziotti’s research interests are in clinical outcomes. He has interest in clinical outcomes for patients with biliary dyskinesia treated with laparoscopic cholecystectomy compared to patients with gallstones treated in the same fashion. He also has ongoing projects evaluating clinical outcomes in patients with perforated appendicitis, spontaneous pneumothorax, and in patients with ITP undergoing laparoscopic splenectomy.

Bindi Naik-Mathuria, MD, FACS  
Assistant Professor of Surgery and Pediatrics  
Division of Pediatric Surgery  
Baylor College of Medicine  
Trauma Medical Director  
Texas Children’s Hospital

Keywords
- Pediatric trauma
- Pediatric oncology
- Congenital anorectal malformations and gastrointestinal anomalies

Research interests
Dr. Naik-Mathuria’s research interest is in pediatric trauma; specifically in the areas of quality improvement and outcomes. Our team develops protocols to improve our hospital's pediatric trauma program, and then studies the effects of the protocols. Additionally, we study outcomes from various aspects of pediatric trauma based on our hospital registry as well as national data registries. We are also involved with several multicenter prospective studies in order to understand the best options for optimal care of pediatric trauma patients. Residents would also have the opportunity to participate in injury prevention studies and community interventions, as well as in educational projects. Obtaining a degree in masters in public health concurrently with the research time would be an ideal complement, but is not a requirement.

Oluyinka O. Olutoye, MBChB, PhD  
Professor of Surgery and of Pediatrics and Obstetrics & Gynecology  
Division of Pediatric Surgery  
Baylor College of Medicine  

Co-Director, Texas Children’s Fetal Center  
Texas Children’s Hospital  

Keywords  
- Congenital diaphragmatic hernia  
- Necrotizing enterocolitis  
- Fetal neurotoxicity  

Research Interests  
Dr. Olutoye has a broad range of research endeavors ranging from basic science research using animal models of disease to robust clinical research. He has an active basic science laboratory currently focused on three main areas of research: wound healing, necrotizing enterocolitis (NEC) and fetal interventions. Hypertrophic scarring and keloids can be disfiguring conditions for many patients. Working with a pig model for hypertrophic scars he is studying the effects of Serum Amyloid P (SAP) on fibrocyte inhibition with hopes of developing a therapy that may be translated to treatment of keloids in humans. Early diagnosis of Necrotizing Enterocolitis (NEC) continues to be a clinical challenge. Using a premature piglet model of NEC, he is attempting to identify non-invasive measures as well as serum biomarkers that will allow for early detection of neonates at risk for NEC. In collaboration with multiple subspeciality colleagues he is using time-dated pregnant sheep models to study innovative techniques in fetal intervention to treat conditions such as spina bifida and congenital diaphragmatic hernia (CDH) as well as the effects of fetal anesthesia on the developing brain. Dr. Olutoye also has a great deal of interest in the clinical application of NIRS technology for a variety of neonatal conditions: CDH patients before and after surgical correction, those undergoing extracorporeal membrane oxygenation (ECMO), neonates pre and post patent ductus arteriosus (PDA) ligation and abdominal complications in neonates with congenital heart defects.  

Dr. Olutoye has a special interest in surgical education, especially global surgery.

Selected publications

Sanjeev A. Vasudevan, MD
Assistant Professor of Surgery and Pediatrics
Division of Pediatric Surgery and Surgical Research
Baylor College of Medicine

Keywords
- Pediatric surgical oncology
- Neuroblastoma
- Pediatric liver cancer
- p53 regulation, and MYCN tumorigenesis

Research Interests
Dr. Vasudevan’s laboratory focuses on validation of potential therapeutic targets found in pediatric solid tumors and cancer, in particular neuroblastoma and hepatoblastoma. During his postdoctoral training in the Texas Children’s Cancer Center with Drs. Jed G. Nuchtern and Jianhua Yang, Dr. Vasudevan cloned two novel genes, NDSP and DUSP26, which were found to be specifically expressed in neuroblastoma and play critical roles in neuroblastoma tumor growth and chemosensitivity. Dr. Vasudevan is furthering this work as a principal investigator by focusing on the function and regulation of the p53 pathway in both neuroblastoma and hepatoblastoma. He is also helping to develop patient derived xenografts for these tumors in order to better study the biology and develop patient-specific therapies. Dr. Vasudevan’s lab hopes to validate multiple targets in order to find novel and less toxic therapeutic agents to improve outcomes in neuroblastoma and hepatoblastoma.

David E. Wesson, MD
Professor of Surgery
Division of Pediatric Surgery
Baylor College of Medicine
Associate Surgeon-in-Chief
Chief, Department of Surgery
Texas Children's Hospital

Keywords
- Pediatric trauma
- Pediatric injury prevention
- GI disorders

Research Interests
Dr. Wesson has been interested in research relating to pediatric trauma and pediatric injury prevention for over 30 years. For example, he participated in some of the earliest definitive studies on the non-operative treatment of solid organ injuries in children. This research helped to define the indications for operation in children with splenic trauma. This approach was very controversial when first described but it has since become the standard of care for children around the world, and more recently in all age groups. Dr. Wesson’s interest in pediatric injury prevention grew out of his experience in pediatric trauma care. This led to his research into the promotion of bike helmet use and the subsequent impact on the incidence of fatal bicycling injuries in a defined population of children. Dr. Wesson also played a role in the development of the trauma system in the City of Toronto and the Province of Ontario, Canada. His research into the incidence of preventable trauma deaths among children in Ontario documented a significant overall reduction in the incidence of fatal injuries and in the proportion of preventable deaths over the period from the late 1980’s to the early 2000’s. His research supported the hypothesis that these improvements were attributable to improvements in the system of care. Dr. Wesson has a variety of other research interests particularly in gastrointestinal disorders in children. He published one of the earliest studies of the results of restorative proctocolectomy in children with ulcerative colitis and familial polyposis. He also has a strong interest in the treatment of biliary atresia and entered many of his patients with this disease into the NIH funded study of this problem by the Bilary Atresia Research Consortium (BARC).

Jingling Jin, PhD
Assistant Professor of Surgery
Division of Pediatric Surgery
Baylor College of Medicine

Keywords
- Hepatoblastoma
- Hepatocellular carcinoma
- Neuroblastoma

Research interests

1. The discovery and development of therapeutic targets in hepatoblastoma, hepatocellular carcinoma and neuroblastoma: Dr. Jin's main focuses of interest are in applying comprehensive basic science approaches to validate novel drug targets for molecular pathways of hepatoblastoma, hepatocellular carcinoma and neuroblastoma in animal and cell models and in human tissues and to develop potential treatments for patients with these diseases. Recently, we found that NR5A2 (nuclear receptor subfamily 5, group A, member 2) may play an important role in the development of hepatoblastoma. The work is directly relevant for the developing new treatment options for pediatric patients with liver cancer.

2. Diet, energy balance, metabolic diseases and liver cancer: The liver is a major metabolic organ for the regulation of fatty acid, insulin and glucose signaling. Metabolic diseases such as diabetes and obesity are risk factors for liver cancer, suggesting an important role for energy balance. Diet including sugars and fats may also contribute to the development of liver cancer. Dr. Jin found that the development of non-alcoholic fatty liver disease (NAFLD) is associated with the epigenetic increase of triglyceride synthesis through the activated p300-C/EBPα/β pathway under high fat diet protocols and in livers of patients with NAFLD. We aim to use these findings to better understand the interaction of dietary and environmental exposures that affect liver function and regeneration, as well as liver cancer.

3. Mechanisms and implications of age-related changes in the liver: Dr. Jin is interested in translational projects to determine the role of transcription factors in aging and in age-related diseases such as age-related loss of liver regeneration and liver cancer. Dr. Jin found that the age-associated liver cancer is caused by the elimination of C/EBPα through the ubiquitin-proteasome system. In addition, she discovered a novel mechanism of liver cancer development is through a tight regulation of levels of C/EBPβ-HDAC1 complexes on the levels of transcription, translation, and posttranslational modifications. These findings may increase our understanding of cancer pathogenesis and rejuvenation of aging liver and suggest novel approaches to therapies.

Sundeep Keswani, M.D.
Associate Professor of Surgery
Division of Pediatric Surgery
Baylor College of Medicine

Keywords
- Fetal Diagnosis and Therapy
- Wound Healing
- Regenerative Medicine

Research interests
Dr. Keswani is a member of the pediatric surgery and fetal surgery team at Texas Children’s Hospital and the principal investigator for the Texas Children’s Laboratory for Regenerative Tissue Repair. Dr. Keswani completed his adult general surgery training at Louisiana State University in his hometown of New Orleans and completed his pediatric surgery fellowship at St. Louis Children's Hospital and the Washington University School of Medicine. He also completed a research fellowship and fetal surgery fellowship at the Children's Hospital of Philadelphia. Prior to coming to Texas Children’s, Dr. Keswani was an attending surgeon at Cincinnati Children’s Hospital. Dr. Keswani’s clinical interests are in fetal diagnosis and therapy, neonatal surgery, congenital diaphragmatic hernia, ECMO and pediatric wound care. His NIH-funded laboratory studies the molecular mechanisms of regenerative fetal tissue repair and is actively developing novel therapeutics to achieve postnatal regenerative wound healing.

Plastic Surgery

Division faculty members pursue a wide variety of clinical and basic science research projects. The majority of this work focuses on improving the care of patients with facial injuries or congenital deficiencies.

The division, for example, is currently leading a large-scale study of outcomes in pediatric craniofacial surgery. Faculty members have also been studying new and better treatments for mandibular fractures, including studies evaluating the biologic response to resorbable plate and screw fixation, and a clinical study to determine the optimal method to stabilize mandibular fractures.
Research Interests

Dr. Hollier has a broad background in craniosynostosis procedures. As the chief of the largest group of full-time, academic craniofacial surgeons in the United States, he believes he has an opportunity to substantially contribute to this subject.

He has undertaken an enormous research effort focused on quantifying outcomes in craniofacial surgery. He and other senior researchers in the department are currently applying for a new NIH funded project which will allow them to take that effort to the next level by stratifying craniosynostosis patients according to their unique genetic background. By accurately defining the true underlying genetic causes, procedures can be custom tailored for each patient and patients can be properly educated regarding their expected course of treatment. Dr. Hollier feels that this is something that has been sorely lacking in plastic surgery. For too long, plastic surgery has been a specialty where outcomes are deemed acceptable so long as the patient and their family are happy. He believes plastic surgery should be elevated to the next level of scientific scrutiny, and is dedicated to leading the endeavor.

SURGICAL ONCOLOGY

Developing novel approaches for cancer gene therapy, immunotherapy, non-invasive radiofrequency field therapy to enhance tumor blood flow and produce modulated tumor-specific hyperthermia, use of nanotechnology to improve cancer detection, and robotic surgery are among the division's several basic science research pursuits. Areas of recent translational research focus have included the compilation of tissue-based databases that help track and understand patient outcomes in pancreatic, hepatobiliary, and colorectal cancers. Additionally, our clinical research initiatives include detecting genetic profiles and differences in circulating tumor cells in patients with primary and metastatic colorectal cancer, developing hyperthermic treatment programs for patients with peritoneal-based malignancies, and expanding neoadjuvant treatments in patients with pancreatic, hepatobiliary, colorectal, and breast malignancies.
Keywords

- Electromagnetic fields in diagnosis and treatment of disease
- Novel cancer therapies
- Nanotechnology applications in biomedical research and treatments

Research interests

Dr. Curley has been leading a basic sciences laboratory for 25 years. Currently, his research centers on the design, bench testing, and clinical study of novel noninvasive radiofrequency (RF) field treatment devices. Having developed two FDA-approved devices for invasive radiofrequency ablation needles to treat unresectable liver cancers, his current studies focus on targeted delivery of metallic or semiconducting nanoparticles that release heat under RF field induction to cause thermal cytotoxicity in cancer cells. His group has also performed complex physicochemical measurements of nanoparticles, and has conjugated them to antibodies, peptides, and pharmacologic agents to target cancer cells. He hopes to test these novel treatments in human clinical trials at BCM within the next two to three years, pending FDA approval. State-of-the-art techniques in molecular biology, cancer immunotherapy, medicinal chemistry, intravital microscopy, cancer cell culture and testing, preclinical animal models of cancer, and scanning electron microscopy are among the techniques trainees will learn and use during their time in the highly productive laboratory environment.

VASCULAR SURGERY & ENDOVASCULAR THERAPY

Our faculty physicians in the Division of Vascular Surgery and Endovascular Therapy at Baylor College of Medicine are widely recognized as leaders in the fields of vascular surgery and endovascular therapy at several institutions in the Texas Medical Center, including Baylor St. Luke’s Medical Center, the Texas Heart Institute, Texas Children’s Hospital, the Michael E. DeBakey VA Medical Center and Ben Taub Hospital.

Equipped with state-of-the-art resources and funded by the National Institutes of Health, the American Cancer Society, the Dan L Duncan Comprehensive Cancer Center, the National Institute of Neurology Disorders and Strokes, and the Department of Veterans Affairs, the research center conducts basic science programs in vascular biology, pancreatic cancer research, surgical immunology, and cancer vaccination.

To ensure that the newest treatment options are available to patients with vascular disease, the division actively participates in several clinical trials that evaluate new devices for the treatment of abdominal aortic aneurysms and peripheral arterial disease.

Our research efforts in clinical outcomes following surgical or endovascular treatment of aneurysms, dialysis interventions, lower extremity occlusive disease, and carotid disease, have helped define standards of care in vascular disease management.

Interdisciplinary Consortium on Advanced Motion Performance (iCAMP) is an interdisciplinary research and development collaboration led by Bijan Najafi, Ph.D., between a host of productive, exciting, creative teams - from Vascular Surgery, Orthopedics, Podiatrist, Nursing, Geriatrics, Anthropology and Engineering at the Baylor College of Medicine (Michael E. DeBakey Department of Surgery, Division of Vascular Surgery and Endovascular Therapy).

Baylor College of Medicine

Keywords
• Diabetic foot ulcers
• Diabetic limb salvage
• Infrainguinal bypass

Research interests
Dr. Barshes is an academic vascular surgeon with a focus on the prevention and management of the limb-threatening foot complications associated with diabetes mellitus and/or peripheral arterial disease. His research activities have spanned the spectrum of care for this problem, including: foot ulcer prevention efforts; the microbiology of isolates involved in foot infections; patient selection for revascularization; the timing of soft tissue reconstruction after revascularization; and the cost-effectiveness of prevention and management strategies for peripheral arterial disease and non-healing foot ulcers. The clinical research methodologies used to investigate the research questions for these clinical topics have included randomized controlled trials, large database research, retrospective cohort studies with multivariate analyses and/or propensity scoring, and Markov model simulation with formal cost-utility analyses. Current efforts and plans for future direction include further studies are also focused on further optimizing the value of limb preservation efforts, especially through the improved coordination of multidisciplinary care within the context of a vertically-integrated health care system.

Panos Kougias, M.D.
Associate Professor of Surgery
Division of Vascular Surgery & Endovascular Therapy
Baylor College of Medicine
Vascular Surgery Section Chief
Michael E. DeBakey VA Medical Center

Keywords
- Endovascular treatment abdominal aortic aneurysms
- Systems re-design and health care delivery optimization
- Carotid endarterectomy and stenting

Research interests
Dr. Kougias’s research interest focuses exclusively on clinical research within the following two areas:
1) Randomized controlled trials to answer critical clinical questions and address systems re-design issues
2) Observational studies utilizing large datasets from institutional or nationwide databases.
He currently runs two randomized controlled trials funded from a VHA Career Development Award and a VHA Merritt Review Award. Our group also runs more than 25 observational studies on topics that cover the areas of limb salvage, operating room time utilization, carotid disease and vascular infections, among others. He has mentored 12 students and/or residents over the past 3 years with a philosophy that emphasizes a progressive initiation of the mentee into the principles of clinical research; research question inception, data collection, data analysis, and scientific presentation/writing. Two of his current mentees are pursuing formal training in Clinical Research and/or Epidemiology as part of their research curriculum.

Research interests

Dr. Najafi’s unique expertise is the translation of wearable technologies for more accurate movement assessment of patients in their natural environment where they're the most comfortable and active. His goal is to better understand how people move through their environment. In this way, he believes we may be able to fundamentally change the way we objectively measure quality of life for people across disciplines. He has assisted in successful translation of several innovative technologies for commercialization in the area of remote heath monitoring, precision medicine, and movement assessment including several wearable and mHealth technologies for activities monitoring, gait analysis, balance assessment, automatic fall detection (PAMSys™, LEGSys™, BalanSens™, ACTIVPers™, etc), patient adherence (PAMTag™), and various technologies for foot problems management including prevention of diabetic foot ulcers (SmartSox Novinoor, SurroSens Orpyx, SmartMat, and Podimetrics).

He has mentored 150+ postdoc, research fellows/interns, graduate, undergraduate, premed, and medical students, several of them received prestigious awards from their achievements while working in his team. He is also serving as Editor, Associate Editor, and guest editors for several scientific journals including Section Editor for Gerontology, ‘Regenerative and Technological Section’, Journal of Surgery, Journal of Diabetes Science and Technology, and Journal of American Podiatric Medical Association (JAPMA). He has served as the chair of research operation at the Southern Arizona Limb Salvage Alliance (SALSA), a collaborative clinical and research alliance dedicated to advancing care of the diabetic foot and preventing amputations in North America and worldwide.

Selected publications

Miguel Montero-Baker, M.D.
Associate Professor of Surgery
Division of Vascular Surgery and Endovascular Therapy
Baylor College of Medicine

Keywords
- Critical limb ischemia
- Endovascular
- Implantable technology

Research interests

Dr. Montero-Baker graduated with honors both from medical school and his residency in Vascular Surgery at the University of Costa Rica. After his residency training, he was awarded a DAAD (German Academic Exchange Service) scholarship to further pursue his interest in interventional therapies in Leipzig, Germany and completed a peripheral vascular ultrasound fellowship, as well as an advanced peripheral endovascular interventions fellowship. Driven by his passion for research and development of new diagnostic techniques for ischemic limbs, Dr. Montero-Baker completed an Integrated Vascular Surgery Residency at the University of Arizona and went on to join the faculty as an assistant professor.

Dr. Montero-Baker is author of numerous journal publications, has co-authored several textbook chapters and is a well-recognized opinion leader for the Latin American medical community. Dr. Montero-Baker’s main clinical interests are critical limb ischemia, implantable micro-technology and endovascular carotid disease management.

He is an active member of the Society for Vascular Surgery, the International Society for Vascular Surgery, the International Society of Endovascular Surgeons, Endovascular Surgeons of Latin America and the Latin America Society of Vascular Surgeons.

The Research Core at the Michael E. DeBakey Department of Surgery are pleased to offer you an opportunity to conduct clinical trials through our department representing 130+ faculty members, four major academic clinical centers, and 100,000+ patient visits per year. Our comprehensive clinical trial management services, provided by the dedicated research support team housed in our department, allow us to offer you, as our research partner, an efficient, cost-effective, and high-fidelity way of performing clinical trials under a single IRB platform.

1) Our team: Clinical trial coordinators, regulatory experts, grants and contract managers, research nurses, a biostatistician, a database expert, a medical editor, and a medical illustrator are available to assist with performing clinical trials and preparing the results for presentation.

2) Clinical research support: Our pool of research coordinators can help with clinical trials by working with a research partner to convey proposals all the way from IRB submission to enrollment of the final subject at one or all our 4 major clinical sites of Baylor College of Medicine. Our team includes research nurses, a physician assistant, and five trials management research assistants who are available to support clinical studies. These individuals are skilled at IRB submission, informed consent, clinical monitoring, completing case reports, regulatory compliance, and final report submission.

3) Budget planning: In addition to the support with IRB preparation and actually carrying out the trial, our budget specialists stay on top of the invoicing process and keep the projects financially on track.

4) Our clinical sites: Baylor College of Medicine currently has four potential sites for clinical studies, covered under one IRB: the Michael E. DeBakey Veterans Affairs Medical Center, Ben Taub Hospital, Texas Children’s Hospital, and the Baylor St. Luke’s Medical Center. Our coordinators are credentialed to enroll subjects at all these sites.

Our experienced research core team can be a resource to you in getting your products tested. Please consider the Department of Surgery at Baylor College of Medicine as a potential partner in your next trial. For more information about our core or conducting a trial with us, feel free to contact Dr. Barbara Trautner, at surgicalresearch@bcm.edu.
