Do you have a child with autism spectrum disorder (ASD) and anxiety?

If this is the case, you may be eligible to participate in a study exploring the treatment preferences of parents, who have children with ASD and anxiety. As a result of the study, we hope to gain a better understanding of the population and the types of treatment families prefer for their children.

Participation in the study would involve answering a series of online questionnaires via an anonymous survey link. The questionnaires will ask you about your child's thoughts, feelings, and behaviors. In addition, you will be asked to evaluate several treatment options and services that are typical for treating children with ASD and/or anxiety. Your participation in this survey is expected to take about 25 minutes.

To be eligible for this study, you must be a parent (18+) and have a child (under 18 years old) with a diagnosis of ASD and significant anxiety.

This study is being conducted by Dr. Eric Storch, Ph.D. at Baylor College of Medicine, Houston, TX.
